**Translation as Communication across Languages and Cultures** Juliane

House, 2015-10-30 In this interdisciplinary book, Juliane House breaks new ground by situating translation within Applied Linguistics. In thirteen chapters, she examines translation as a means of communication across different languages and cultures, provides a critical overview of different approaches to translation, of the link between culture and translation, and between views of context and text in translation. Featuring an account of translation from a linguistic-cognitive perspective, House covers problematic

issues such as the existence of universals of translation, cases of untranslatability and ways and means of assessing the quality of a translation. Recent methodological and research avenues such as the role of corpora in translation and the effects of globalization processes on translation are presented in a neutral, non-biased manner. The book concludes with a thorough, historical account of the role of translation in foreign language learning and teaching and a discussion of new challenges and problems of the professional practice of translation in our world today. Written by a highly experienced teacher and researcher in the field, Translation as Communication across Languages and Cultures is an essential resource for students and researchers of Translation Studies, Applied Linguistics and Communication Studies.

**C-C Bond Activation** Guangbin Dong, 2014-09-18 The series Topics in Current Chemistry presents critical reviews of the present and future trends in modern chemical research. The scope of coverage is all areas of chemical science including the interfaces with related disciplines such as biology, medicine and materials science. The goal of each thematic volume is to give the non-specialist reader, whether in academia or industry, a comprehensive insight into an area where new research is emerging which is of interest to a

larger scientific audience. Each review within the volume critically surveys one aspect of that topic and places it within the context of the volume as a whole. The most significant developments of the last 5 to 10 years are presented using selected examples to illustrate the principles discussed. The coverage is not intended to be an exhaustive summary of the field or include large quantities of data, but should rather be conceptual, concentrating on the methodological thinking that will allow the non-specialist reader to understand the information presented. Contributions also offer an outlook on potential future developments in the field. Review articles for the individual volumes are invited by the volume editors. Readership: research chemists at universities or in industry, graduate students

Bio-inspired Catalysts Thomas R. Ward, 2009-02-05 In order to meet the ever-increasing demands for enantiopure compounds, heterogeneous, homogeneous and enzymatic catalysis evolved independently in the past. Although all three approaches have yielded industrially viable processes, the latter two are the most widely used and can be regarded as complementary in many respects. Despite the progress in structural, computational and mechanistic studies, however, to date there is no universal recipe for the optimization of

catalytic processes. Thus, a trial-and-error approach remains predominant in catalyst discovery and optimization. With the aim of complementing the well-established fields of homogeneous and enzymatic catalysis, organocatalysis and artificial metalloenzymes have enjoyed a recent revival. Artificial metalloenzymes, which are the focus of this book, result from combining an active but unselective organometallic moiety with a macromolecular host. Kaiser and Whitesides suggested the possibility of creating artificial metallo- zymes as long ago as the late 1970s. However, there was a widespread belief that proteins and organometallic catalysts were incompatible with each other. This severely hampered research in this area at the interface between homogeneous and enzymatic catalysis. Since 2000, however, there has been a growing interest in the field of artificial metalloenzymes for enantioselective catalysis. The current state of the art and the potential for future development are presented in five well-balanced chapters. G. Roelfes, B. Feringa et al. summarize research relying on DNA as a macromolecular host for enantioselective catalysis.

**Balancing and Sequencing of Assembly Lines** Armin Scholl, 1999-02-26 The book deals with two main decision problems which arise when flow-line production systems are installed and operated. The assembly line balancing problem consists of partitioning the work, necessary to assemble the product(s), among different stations of an assembly line. If several models of a product are jointly processed on a line, this medium-term problem is connected with

the short-term problem of determining an operating sequence of the models. In Part I balancing and sequencing problems are discussed, classified, and arranged within a hierarchical planning system. In the present second edition special emphasis is given to u-shaped assembly lines which are important components of modern just-in-time production systems. Part II is concerned with exact and heuristic procedures for solving those decision problems. For each problem type considered, a survey of existing procedures is given and new efficient solution methods are developed. Comprehensive numerical investigations showing the effectiveness of the new methods and their superiority over existing approaches are reported.
